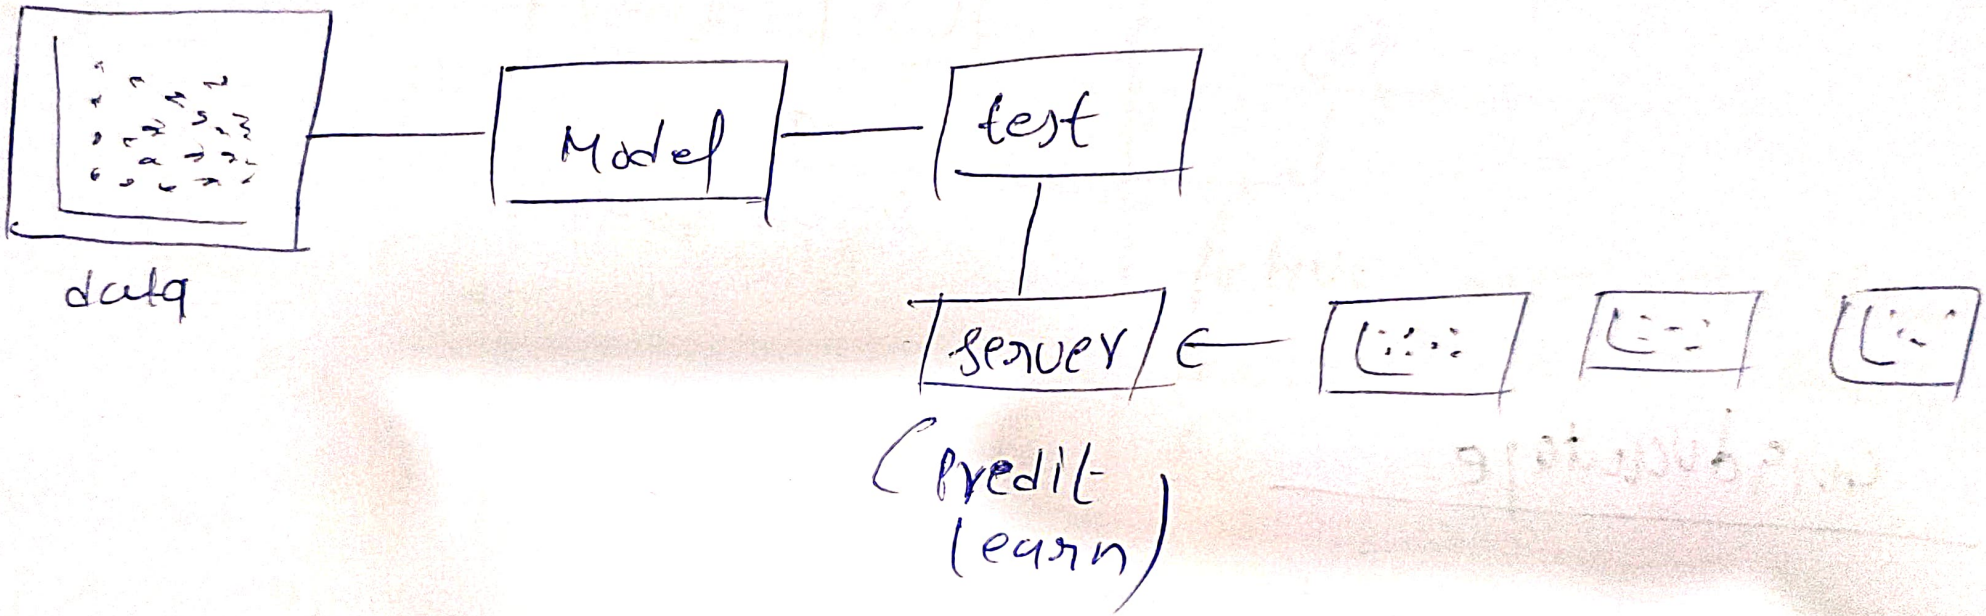
Online Machine learning:-

#day 5 of 100days



Ex:- chatbot - Alexa, Siri

ke change your feed automatically - This is an also example of machine learning.

When to use?

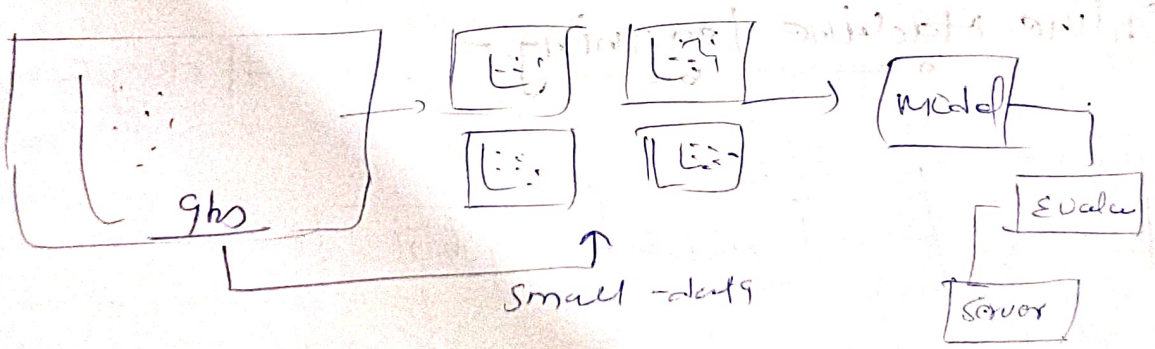
1. where there is a concept drift
2. cost effective [saving]
3. faster solution.

How to use?

learning Rate? How much work frequenty on data. (correct learning Rate Remember leaf data upload on newly Rate)

out of core learning:- so much big data like using an Batch learning can't train the data.

Ex:- total 50gb data but your Ram 8GB



disadvantage

1. Tricky to use
2. Risky

Batch Vs online machine learning

offline learning	features	online learning
less complex as model is constant	complexity	Dynamic complexity as model keep evolving over time
fewer computational, singal time batch-based training	computational power	continuous data ingestion result in consequent model refinement computation.
Easier to implement	use in production	Difficult to implement and managed.
Image classification or anything related to ML, where data pattern remain constant without sudden concept drift	Application.	Used in finance, economics, health, where new data pattern come concetally enmig
Industry proven tools, Eg. scikitlin, Tensorflow, pytorch, keras	Tools	Active research / New prescent mode. tools, Eg. SAMOA, scikitlin-multiflow, streamDM
